

Fix Your Squarespace Social Preview

Why this matters

When someone shares a link to your Squarespace site on LinkedIn, X, or Facebook, a preview card shows up in their feed. If you have not set it up, the platform just pulls whatever it finds, and it rarely looks the way you would want it to.

The good news is Squarespace makes this pretty straightforward to fix. Let's walk through it.

Before you start

You will need admin access to your Squarespace site and a preview image at 1200 x 630px. No code needed.

Step 1 - Set your site-wide social image

This is your fallback. Any page that does not have its own image will use this one, so it is the most important thing to get in place first. Think of it as your brand's default card.

- 1 Log into your Squarespace account
- 2 Go to Settings
- 3 Click SEO
- 4 Scroll down to the Social Sharing section
- 5 Upload your 1200 x 630px image under Social Sharing Image
- 6 Click Save

Step 2 - Give your key pages their own preview

For pages you expect people to share, like your homepage, a services page, or a portfolio piece, it is worth setting a specific preview rather than relying on the site-wide default.

- 1 In your Squarespace editor, open the page you want to update

- 2 Click the gear icon to open Page Settings
- 3 Click the SEO tab
- 4 Fill in the SEO Title (keep it under 60 characters) and SEO Description (up to 160 characters)
- 5 Scroll down to the Social Image section and upload a specific 1200 x 630px image for this page
- 6 Click Save

Worth repeating

Go through your most important pages one by one and do this for each. It only takes a couple of minutes per page and makes a real difference when those links start getting shared.

Step 3 - Sort out your blog posts

If you have a blog on Squarespace, each post can have its own social preview. Squarespace will use your post thumbnail as the preview image if you do not set a specific one, so make sure your thumbnails are sized well.

- 1 Open a blog post in your editor
- 2 Click the gear icon or open the post settings panel
- 3 Go to the SEO tab
- 4 Fill in the SEO Title and SEO Description
- 5 Under Social Image, upload or select a thumbnail for this post
- 6 Click Save

Squarespace and image compression

Squarespace compresses uploaded images automatically. Export your OG image at the highest quality setting in your design tool to avoid it looking soft after upload.

Step 4 - Get your image size right

One size covers every platform. Design to 1200 x 630px and you will not have to think about this again.

Platform	Recommended size
----------	------------------

X (Twitter)	1200 x 630px
LinkedIn	1200 x 627px
Facebook	1200 x 630px
Safe zone	Keep text and logos within the centre 1000 x 530px

Canva has a pre-sized template called Facebook link image that works perfectly. Just export at 1200 x 630px and upload it.

What Squarespace adds to your page

When you fill in those fields, Squarespace drops this into your page's head tag. You never need to touch it yourself, but it is useful to know it is there if you ever need to check something.

```
<!-- Open Graph (Facebook, LinkedIn) -->

<meta property="og:title" content="Your page title" />

<meta property="og:description" content="Your description" />

<meta property="og:image" content="https://yoursite.squarespace.com/image.jpg" />

<meta property="og:url" content="https://yoursite.com/page" />

<!-- Twitter Card -->

<meta name="twitter:card" content="summary_large_image" />

<meta name="twitter:title" content="Your page title" />

<meta name="twitter:description" content="Your description" />

<meta name="twitter:image" content="https://yoursite.com/image.jpg" />
```

Check how it actually looks

Once you have saved your changes, head over to eloho.dev/freebies/social-preview and paste your URL in. You will see exactly what your link looks like across X, LinkedIn, and Facebook, and get a clear breakdown of anything that still needs attention.

Squarespace saves changes live straight away, but platforms hold on to cached previews for a while. If something still looks off, force a refresh using each platform's own tool:

- Facebook: Sharing Debugger at developers.facebook.com/tools/debug, click Scrape Again
- LinkedIn: Post Inspector at linkedin.com/post-inspector, click Inspect
- X (Twitter): Card Validator at cards-dev.twitter.com/validator

Before you call it done

- Site-wide social sharing image set in Settings, then SEO
- Homepage has its own SEO title, description, and social image
- Key pages have their own SEO title, description, and social image
- Blog post thumbnails are at least 1200 x 630px
- Important blog posts have their own SEO title and description
- Checked with eloho.dev/freebies/social-preview

Done? Run your other pages through too.

It is easy to fix the homepage and forget the rest. Paste any URL into eloho.dev/freebies/social-preview and you will see exactly what shows up when that page gets shared.
