

Fix Your Webflow

Social Preview

A step-by-step guide to making your links look great on X, LinkedIn, and Facebook

Why this matters

Every time someone shares a link to your Webflow site, platforms like X (Twitter), LinkedIn, and Facebook pull a title, description, and image to display as a preview card. If you have not set these up, the platform guesses and usually gets it wrong.

A missing image alone can cut click-through rates by 3 to 4x. This guide walks you through the exact steps to fix it directly inside Webflow, no plugins or code needed.

What you will need

A Webflow site with Editor or Designer access. A social preview image at 1200 x 630px. No coding required.

Step 1 - Set your default OG tags (site-wide)

This applies to every page on your site that does not have its own custom settings. Set this first so you always have a fallback.

- 1 Open your project in the Webflow Designer
 - 2 Click the Pages panel (the page icon in the left sidebar)
 - 3 Click the gear icon next to your Home page to open Page Settings
 - 4 Scroll down to the SEO Settings section
 - 5 Fill in your Title tag (50 to 60 characters) and Meta description (up to 160 characters)
 - 6 Scroll further to the Open Graph Settings section
 - 7 Fill in OG Title, OG Description, and OG Image - upload your 1200 x 630px image
 - 8 Click Save
-

Step 2 - Set OG tags per page

For important pages like your homepage, landing pages, and blog posts, set page-specific previews so they do not all look the same when shared.

- 1 In the Pages panel, click the gear icon next to any page you want to customise
- 2 Scroll to Open Graph Settings
- 3 Fill in the OG Title, OG Description, and OG Image for that specific page
- 4 Click Save
- 5 Repeat for each important page

Pro tip

The more specific the preview, the more relevant it feels to the person seeing it in their feed - which directly affects whether they click.

Step 3 - Set OG tags for CMS items (blog posts etc.)

If you are using Webflow CMS for a blog or portfolio, you can bind OG fields to your CMS fields so every post automatically gets its own preview.

- 1 Go to the Pages panel and open your CMS Collection Template page
- 2 Open Page Settings (gear icon)
- 3 In the SEO Settings and Open Graph Settings sections, click the purple binding icon next to each field
- 4 Bind OG Title to your Post Title field
- 5 Bind OG Description to your Post Summary or Excerpt field
- 6 Bind OG Image to your Post Thumbnail or Cover Image field
- 7 Click Save

Pro tip

If your CMS does not have a dedicated thumbnail field, add one and name it OG Image. Set the recommended size to 1200 x 630px so your team knows what to upload.

Step 4 - Create the right image

The most common reason previews look bad is the wrong image size. Each platform has slightly different requirements, but one size covers all of them.

Platform	Recommended size
X (Twitter)	1200 x 630px (summary_large_image card)
LinkedIn	1200 x 627px
Facebook	1200 x 630px
Safe zone	Keep text and logos within the centre 1000 x 530px

Free tools: Canva has a pre-sized Facebook link image template. Figma works great too. Export at 1200 x 630px from any design tool.

Webflow tip

When uploading your OG image in Webflow, it gets hosted on Webflow's CDN automatically. No need to host it elsewhere.

Step 5 - What Webflow adds to your HTML

For reference, here is what Webflow automatically inserts in your page head when you fill in the OG fields. You do not need to add these manually.

```
<!-- Open Graph (Facebook, LinkedIn) -->

<meta property="og:title" content="Your page title" />

<meta property="og:description" content="Your description" />

<meta property="og:image" content="https://yoursite.webflow.io/image.jpg" />

<meta property="og:url" content="https://yoursite.com/page" />

<!-- Twitter Card -->

<meta name="twitter:card" content="summary_large_image" />

<meta name="twitter:title" content="Your page title" />

<meta name="twitter:description" content="Your description" />
```

```
<meta name="twitter:image" content="https://yoursite.com/image.jpg" />
```

Note

Webflow sets `twitter:card` to `summary_large_image` by default, which gives you the large image format on X. No extra configuration needed.

Step 6 - Verify it is working

Before you share anything important, check exactly what your links look like using **eloho.dev/freebies/social-preview**. Paste your URL in and you will see your preview across X, LinkedIn, and Facebook instantly, plus a breakdown of what is missing or needs fixing.

Each platform also has its own cache-clearing tool:

- Facebook: Sharing Debugger at developers.facebook.com/tools/debug, click Scrape Again
- LinkedIn: Post Inspector at linkedin.com/post-inspector, click Inspect
- X (Twitter): Card Validator at cards-dev.twitter.com/validator

Webflow publishes changes live when you hit Publish, but platforms cache previews for hours or days. Always use the debuggers above to force a refresh after updating your OG tags.

Quick checklist

- Site-wide OG title, description, and image set in Page Settings
- Homepage has its own specific OG tags
- Key landing pages have their own OG tags
- CMS template pages have OG fields bound to CMS data
- All OG images are 1200 x 630px
- Verified with eloho.dev/freebies/social-preview

Done? Check your other pages.

Run any page URL through eloho.dev/freebies/social-preview to see exactly what shows up when it gets shared, and catch anything that is still missing before it goes out into the world.
